

Greetings,

Pulsafeeder proudly continues its mission of offering world-class support and innovative solutions to the industries that are the backbone to all of our lives. Given the current environment, we are putting a special focus on the disinfection and manufacturing of disinfectants that are more important than ever.

Less Maintenance. This month, we announced the **Hypo Valve Addition** to the Pulsapro family – which brings proven technology that's been deployed in the field for decades (via the Pulsar and Pulsar Shadow pumps) to our latest Pulsapro line. The Hypo Valve is used for pumping effervescent fluids such as Sodium Hypochlorite, which are common in disinfection applications. The Hypo Valve allows pressurized process fluid to cyclically flush liquid and vapors through the pump's discharge check system, while maintaining high performance and chemical dosing accuracy. This avoids common issues, such as vapor-lock, which lead to reduced capacity and inaccurate chemical dosing, while also preventing unnecessary maintenance work. For

Pumps are used in
Disinfection Applications

more details, please click on the Press Release Thumbnail.

Trusted Expertise. This past month we added new content to the [Disinfection Application Page](#) of [pulsa.com](#) – describing how our diaphragm and gear pumps are used in municipal and industrial water disinfection applications – as well as how the pumps are used by manufacturers to produce a wide variety of disinfectants. Have a look and contact us to learn more about the solutions we offer that fit your process.

You may have noticed our Linked In and Twitter feeds featured a variety of posts commenting on Disinfection Applications this month. You can view them here:
